NAME : Neha
BRANCH : Integrated M. Tech Data Science
SEMESTER : Fall Semester 2026-27

BIRTHDAY REMINDER SYSTEM

1. Introduction

Birthday Reminder System is a simple Python application that helps users remember their birthday. The program takes the user's name and date of birth only once. It checks the current date and displays a birthday reminder.

2. Objective

- To create a simple birthday reminder using Python.
- To check whether the birthday is today.
- To calculate the days remaining for the next birthday.
- To practice Python date and time operations.
- To automatically stop the program after execution.

3. Technologies Used

- Language: Python
- Module: datetime
- Platform: Python IDLE / VS Code

4. Requirements

Hardware: Computer/Laptop, Keyboard, Monitor

Software: Python 3.x

5. Working

6. The program starts.

7. The user enters their name.

8. The user enters their birthday in DD-MM-YYYY format.
9. The program gets today's date.
10. It compares the birthday with today's date.
11. If the birthday is today, a birthday message is displayed.
12. Otherwise, the remaining days are calculated.
13. The program displays the result and automatically stops.

14. Algorithm

15. Start.
16. Import "datetime".
17. Enter name and birthday.
18. Convert birthday into date format.
19. Get the current date.
20. Compare both dates.
21. Display the appropriate reminder.
22. Calculate remaining days if required.
23. Stop.
24. Flowchart

```

      graph TD
      START([START]) --> EnterName[Enter Name]
      EnterName --> EnterBirthday[Enter Birthday]
      EnterBirthday --> ValidateDate[Validate Date]
      ValidateDate --> GetTodayDate[Get Today's Date]
      GetTodayDate --> CompareBirthday[Compare Birthday]
      CompareBirthday --> Same{Same?}
      Same -- Yes --> HappyBirthday[Happy Birthday]
      Same -- No --> CalculateDaysLeft[Calculate Days Left]
      CalculateDaysLeft --> DisplayResult[Display Result]
      DisplayResult --> STOP([STOP])
      
```

25. Main Python Concepts

- Variables

- "input()"
- "if-else"
- "try-except"
- Functions
- "datetime" module
- Date calculation

26. Sample Input

Enter your name: NehaEnter your birthday (DD-MM-YYYY):
30-09-2006

27. Sample Output

Name: NehaBirthday: 30-09-2006
Your birthday is not today.Days left: 3Next Birthday: 30-09-
2026
PROGRAM STOPPED SUCCESSFULLY

28. Advantages

- Simple and easy to use.
- Requires only one-time input.
- Automatically calculates remaining days.
- Automatically stops after execution.

29. Future Scope

The project can be improved by adding multiple users, permanent data storage, email notifications, mobile notifications, and a graphical user interface.

30. Conclusion

The Birthday Reminder System is a simple Python project that demonstrates the use of input, conditional statements, exception handling, and the "datetime" module. It provides a quick birthday reminder and automatically stops after completing its task.
